GeoCalculator [Win/Mac] (Final 2022)

This application generates a geoplan activity in Google Maps. The geoplan activity generates a route defined by several waypoints, according to a set of parameters. This can be done by entering latitude and longitude coordinates or by dragging the map. To close the geoplan activity, you must click on the red stop icon. GeoCalculator Features:

1. Create a geoplan activity in Google Maps.
2. Receive coordinates of the waypoints in a dialog.
3. Add waypoints or change them in the dialog.
4. Add start and stop coordinates of the geoplan activity.
5. Generate a route using waypoints.
6. Hide the geoplan activity when it has ended.
7. Stop the geoplan activity when it has ended.
8. The geoplan activity can be modified and saved to a file.
9. GeoCalculator is also able to copy the coordinates of a geoplan activity to the clipboard.
10. Create a geoplan activity in Google Maps with multiple layers.
11. Add waypoints and manage them with the geoplan activity's layers.
12. Create a geoplan activity with 3 layers.
13. Set the geoplan activity's layers and hide them.
14. You can select the geoplan activity's layers or the geoplan activity itself to copy.
15. Hide a geoplan activity after creating it.
16. Move a geoplan activity or its layers between geoplan activities.
17. Close a geoplan activity.
18. Add a geoplan activity to a geoplan activity.
19. You can import/export geoplan activities as a Geoplan file or as a Gpx file.
20. You can save geoplan activities as a Geoplan file or as a Gpx file.
21. You can save a geoplan activity after editing it.
22. When you have multiple geoplan activities, you can display them on top of each other.
23. You can hide a geoplan activity.
24. You can hide a geoplan activity's layers.
25. You can drag a geoplan activity or its layers between geoplan activities.
26. When you have multiple geoplan activities, you can switch them with the Tab key.
27. When you have multiple geoplan activities, you can change the order of geoplan activities.
28. When you have multiple geoplan activities

GeoCalculator Crack

GeoCalculator is mainly a library that can be used to calculate a great number of variables within a GIS application (using a single function). In addition to this, it also comes with a simple GUI that is designed to be used as a test tool. WITH GeoCalculator there are several possibilities: Find distances between two points or polygons, taking in consideration the parameters that you wish to calculate. In this case, GeoCalculator will calculate the distance (m) or the bearing (degrees) between two points (latitude or longitude) or the distance between a point and a polygon (m). Calculate ellipsoid parameters (using WGS84, Pulkovo-42, Pulkovo-95, SK42, SK95, PZ90 or Bessel 1941 Europe). Calculate spatial coordinates. Calculate the initial azimuth of a point based on the distance and other input values. Calculate the final azimuth or bearing of a point based on the initial azimuth, the distance and other input values. As you can see, GeoCalculator is mainly a library that is able to calculate a great number of variables within a GIS application (using a single function). If you are an application developer, it is recommended to include the dll within your project. License and technical information: Support: Please use the [support] button to get immediate help or to send an email if you have any questions. Your kind appreciation is very much appreciated and will motivate me to develop further. Note: GeoCalculator can be integrated within any GIS application that requires the calculation of various geo variables. GeoCalculator can be used as a dll, so it is recommended that you integrate it into your GIS application. If you are using the test application, it is recommended that you print the results within the application (using the print function) instead of saving them to file. The download package also includes an explanation of how the input values are used, how GeoCalculator determines the variables, the internal workings and the results (in the form of a simple example) of the calculations. Disclaimer: I do not accept any kind of responsibility or liability for any kind of damage that may be caused by the use of this library. 1d6a3396d6

GeoCalculator Crack [Mac/Win]

In this section, we provide a detailed description of the individual components included in the GeoCalculator package. These components can be used to calculate various input values, output results or perform spatial coordinates. GeoCalculator Description: GeoCalculator is the main component of the GeoCalculator package. It is a standalone C++ project containing a GUI that makes it very easy for a user to enter the desired input values and generate the output results. GeoCalculator Description: This component contains a resource file that contains the GUI options of the application. GeoCalculator Description: This component contains the standard DLL file that is used to integrate the application into your GIS application. GeoCalculator Description: The test application demonstrates how this component works in practice. GeoCalculator Description: This component contains the test application that contains the necessary options to enter the input values for the component and generate the desired output. For more information on how the GeoCalculator component works, see the README file. QGIS API for Linux/Mac is a plugin that allows users to create and manipulate vector data on the desktop Feature: QGIS API for Linux/Mac is a plugin that allows users to create and manipulate vector data on the desktop This allows you to load a.csv file into QGIS, export the data as a variety of file formats, calculate coordinates, create new layers and manipulate any of the loaded data. More than just a plugin, the Qt4 API also allows you to integrate it into your own applications. License: Granular is a plugin that allows you to create and manipulate vector data on the desktop Feature: Granular is a plugin that allows you to create and manipulate vector data on the desktop It allows you to load a.csv file into QGIS, export the data as a variety of file formats, create new layers, display and manipulate them as new features and manage the loaded data. More than just a plugin, the Qt4 API also allows you to integrate it into your own applications. License: RJ's Layer Navigator is a plugin that allows you to easily explore the various data layers contained in the loaded maps Feature: RJ's Layer Navigator is a plugin that allows you to easily explore the various data layers contained in the loaded maps This plugin

What's New in the?

GeoCalculator is a Windows software application whose purpose is to help you perform calculations and conversions for geological data. It supports many calculations, such as lines of intersection, angles between lines and planes, apparent dips, rotations, as well as oriented and partially oriented drill hole calculations. Format conversions include dip/dip dir'n to strike/dip, azimuth to quadrant notation, and pitches/rakes/hades to plunges. User interface The GUI may seem a bit overwhelming at a first glance because the program integrates all supported calculations in a single panel. However, they are well organized so you can quickly get an idea where to get started. In your rescue comes the help manual which provides extra details about the program's features. Data importing options You are allowed to manually type in the line or plane orientation directly in the primary panel, or import batch data from ASCII text files or clipboard content. A dedicated window reveals the results. Supported calculations GeoCalculator gives you the possibility to perform all sorts of calculations, which are related to angle between two lines or planes, angle between line and plane, line of intersection between two planes, plane bisecting two lines, and rotation of a line or plane around an axis. What's more, the application helps you convert line pitch in a plane to plunge and line plunges to pitch in a plane. Conversions can also be carried out between orientation conventions of a given plane or line. You are offered the chance to work with different types of drill core orientations (oriented, partially or un-oriented), perform batch processing of drill hole data, save the results in ASCII format to output files, and check out the results in a stereographic projection window which can be copied to GEOrient plots. An overall efficient geological structural calculator All in all, GeoCalculator comes packed with several handy features for helping you calculate various parameters for structural oriented planes, and is suitable especially for advanced users. In case you want to skip the installation steps, you can have a look at the portable version of the utility, GeoCalculator Portable. Note: The application is free to use for academic and non-commercial purposes but the batch processing function is limited to five entries. For other uses you need to purchase a license. GeoCalculator Keywords Suggested items for keyword research Save time 5 hours of user time saved. 0 comments Add comment Your name: Your e-mail: URL: Comment: Eg. you have a blog, and you want to insert this text content in your blog to start a discussion.Magnetic resonance imaging for detection of meniscal tears. Magnetic resonance imaging (MRI) is useful for diagnosis

System Requirements:

- The NES Classic Edition must be connected to a TV via an HDMI cable - HDMI cable is recommended for playing the games - The Nintendo Classic Switch system, Nintendo Classic Controller, and TV are required to play NES games
How to Play: - Select a game from the list of games below, then press start to play. - Press start to start a game, and hold buttons 1-2, or L+R on the Controller. - To select a game from a list of games below, press start
